

Please find enclosed a protective face mask. Please wash this mask before use. This mask is only to be used for short periods of time when absolutely necessary (eg supermarket trips during an epidemic / pandemic). **It must be washed immediately after each use** in cold or warm laundry detergent or soapy water (but not dish detergent).

High risk persons should not use these masks to do any tasks they are advised against, eg visiting supermarket. However, in the event they need eg cancer treatment, they can be worn as a last resort when no N95 masks are available.

This mask is NOT the same as an N95 mask however it does have an outer layer that is water resistant. This mask may help those unknowingly infected spread a virus by coughing or spitting on to surfaces. To a lesser extent it may be helpful in stopping airborne droplets being breathed in and stop people touching their mouths.

To wear, place both elastic loops over your head. One sits on the lower neck and one on the head. Adjust the knot if needed. Pinch the nose wire around your nose to get a tight seal.

This mask is not medically approved and should only be worn at your own risk. Viruses can also be transferred via surfaces and enter the body in many ways other than the mouth so this in no way guarantees any protection. It is just meant as a means of defence when no medically approved masks are available.
